My International Mobility Projects

ENSEEIHT - Digital Sciences

Three destinations to learn, experiment, and build an international network

My guiding thread

Use my skills in computer science, data, and artificial intelligence to work on useful projects that are both technical and open to the world.

Canada - Senegal - United Kingdom

Three projects inspired by the paths of Yoshua Bengio, Ndiaye Dia, and Wedji Kane.

Why go abroad?

During my Digital Sciences studies at ENSEEIHT, I am developing skills in artificial intelligence, Big Data, software, IoT, and cybersecurity. An international mobility experience would allow me to apply them in other environments, discover new working methods, and better understand the links between research, business, and society.

ENSEEIHT offers several mobility formats: an academic semester, an international internship, a double degree, or a collaborative project. The minimum physical mobility period is 17 weeks for students enrolled in a study program.

I have selected three destinations corresponding to three dimensions of my project: AI research, local impact, and the connection between technology and industry.

My three choices

Destination	What I want to build there
Montreal, Canada	A solid foundation in AI and applied research.
Thies, Senegal	A digital solution adapted to a local need.
Cranfield, United Kingdom	A project linking data, intelligent systems, and industry.

These projects could take the form of a study semester, a research internship, or a final-year project, depending on the opportunities available through my program and mobility agreements.

01 - Montreal, Canada

University of Montreal / Mila

Project: Deepen my skills in artificial intelligence and machine learning in an international research environment.

What I want to learn

I would like to work on machine learning, deep learning, data models, and questions related to responsible AI. The University of Montreal and Mila ecosystem directly matches my interest in AI research and the path of Yoshua Bengio.

What I could do

" Take advanced courses in computer science and AI.

" Join a research project or laboratory.

" Experiment with a model on a concrete problem.

" Present my results as a report, demonstration, or scientific poster.

Skills developed: machine learning; scientific experimentation; data processing; communication in English; international teamwork.

This mobility experience would represent my first immersion in a major global AI research ecosystem.

02 - Thies, Senegal

Thies Polytechnic School (EPT)

Project: Put my skills in computer science and data to work on a concrete problem in Senegal.

What I want to explore

EPT offers engineering training in Computer Engineering and Telecommunications, as well as programs in software engineering and artificial intelligence. This mobility experience would allow me to connect my ENSEEIHT background with Senegal’s technological needs.

Project idea

Develop a digital prototype in one of the following areas: education, health, transport, agriculture, or access to information. The project could combine data collection, automated processing, a web interface, and field deployment.

Skills developed: solution design; software development; needs analysis; adaptation to the local context; collaboration with students and field stakeholders.

This mobility experience would be directly connected to the paths of Ndiaye Dia and Wedji Kane: acquiring technical expertise and transforming it into a useful solution for the surrounding environment.

03 - Cranfield, United Kingdom

Cranfield University

Project: Connect artificial intelligence, connected systems, and industry.

What I want to learn

Cranfield offers courses and projects focused on applied AI, machine learning, data analysis, autonomous systems, and digital transformation. The university is particularly interesting for understanding how technology moves from the laboratory to an industrial application.

What I could do

" Design an intelligent system for an industrial situation.

" Work on a project involving data, IoT, and automation.

" Participate in a project with a research team or company.

" Study the technical, economic, and human effects of a digital solution.

Skills developed: intelligent systems; data engineering; IoT; project management; professional English; relationships with companies.

Cranfield is also identified as a British partner in ENSEEIHT’s double-degree documents, making it a particularly coherent option for my mobility project.

What these three projects say about my profile

These destinations do not correspond to exactly the same objective. Together, they outline the profile of an engineer who wants to understand technology, learn how to build it, and be able to adapt it to different contexts.

Project	Core skill	Link to my project
Montreal	AI research	Understand models and experiment.
Thies	Local impact	Create a solution adapted to Senegal.
Cranfield	Technology and industry	Connect research, data, and application.

My objective is not only to study elsewhere. I want to return with experience, methods, and a concrete project to share with my school and my professional environment.

Next step: compare ENSEEIHT's agreements, application calendars, accessible courses, and funding opportunities in order to choose the destination best suited to my year of study.
